RESEARCH INTERESTS

Algorithms, analysis, and application of statistical signal processing tools to the study of networks. Current research focus is on network topology inference, signal representation and inverse problems on graphs; robust, distributed, and sparsity-aware learning from high-dimensional network data; and spectrum sensing for wireless cognitive networks. Interested in Internet monitoring, social, brain network, power grid, and big data analytics.

TEACHING INTERESTS

The big data revolution not only offers the opportunity but also calls for our responsibility to reposition the signal processing body of knowledge as one of the core components of programs in data and information sciences. Teaching goal is to increase the visibility of statistical and graph signal processing tools to engineering students and beyond, through the development of new curricula and educational material that is accessible to all.
